
- Course Code: PA1482
- Name: Applied Object Oriented Design

GenAI Policy

Note: Throughout this document, "you" refers to students enrolled in the course, "we" refers to examiners/supervisors/teaching team.

The goal of the course assignments is to demonstrate your ability to make use of basic software engineering tools that are an integral part of a modern software development environment. This includes your editor, compilers, debugger, automated test tools, programming language specific documentation tools, microservice container tools, etc.

All GenAI use must align with the objectives and intended learning outcomes defined in the course syllabus. GenAI should support, rather than replace, your demonstration of competencies such as critical thinking and scientific writing.

> The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119.

The document further makes use of the AI Assessment Scale (AIAS) developed by Mike Perkins, Leon Furze, Jasper Roe, and Jason MacVaugh in 2023/2024.

General Principles

Full Responsibility and Accountability

- You **MUST** take total ownership of every word, figure, and line of code; verify all AI-assisted output against primary sources.
- You **MUST NOT** assume that the AI knows best (e.g., using "The AI said so" as a justification), that details do not matter, or that examiners will not notice.

- You **SHOULD** make sure you understand the output of your AI tool and then write/use your own interpretation of it.
- **Motivation**: You are effectively "signing" your assignments as your intellectual output. You must be able to explain, justify, and trace the origin of any part of it. In group work, accountability is collective; all authors are responsible for the entire content.
- **Example**: A student experimented with ChatGPT for generating some program code for a task, but then re-typed it by themselves on a level where they understand what the code does.

Do not Plagiarise

- **Comment**: This is a wider question than just the use of GenAI, but it applies equally to material produced by GenAI tools.
- You **MUST** properly cite and credit any material used in your assignments. This includes the *work* of others, and this includes output from GenAI tools.
- You **MUST NOT** copy-paste or otherwise present the work of others as if it was your own.
- You **SHOULD** make it a habit to always summarise text that you want to use and to immediately add a reference to where you got it from.
- You **MAY** include the prompts you used to generate code or text from a GenAI tool, in order to discuss it with your teacher.
- **Motivation 1**: The assignments are an opportunity for you to show what *you* have learned. By including sources and/or prompts we are able to help you learn more.
- **Motivation 2**: Plagiarism is a serious academic offence: You *must always* give credit to the original author(s).
- **Example**: A student asks Claude to generate different suggestions for the code for a particular task, but then writes their own version which is a combination of several suggestions. They add the prompts used in a source code comment and discuss these with the teacher.
- **Example**: A student finds several ready-made solutions to a programming task online, and writes their own solution inspired by what they have read. They include links to the used pages in a source code comment.

Use AI Tools to Explain, not to Do.

- You **MAY** use AI to explain different commands and overall workflow.
- You **MAY** see this as an opportunity to pratice your ability to find and read documentation and instruction manuals instead of relying on AI tools.
- You **SHOULD** make sure that you understand the tools that you use.
- You **SHOULD** verify what the AI tells you through independent tests.
- You **SHOULD NOT** rely on that the GenAI understand the tools for you.

- You **MUST NOT** blame the AI for any mistakes it does. Those mistakes are yours to catch.
- **Motivation**: You must at least be able to identify when GenAI tools suggests something wrong. Your value as an engineer is further increased if you are also able to work independently with minimal tool or AI support.
- **Example**: An engineer asked an AI tool to generate code to implement a feature and realised that the generated code would break the running system and cost millions of dollars. If they had not independently reviewed the generated code before committing they would not have caught this.
- **Comment**: In industry, the line between explaining and doing is blurred, but SHOULD only be crossed by engineers *who already know what they are doing*. You are still students and are still learning the trade.

Specific Guidelines

Installing Software

- You **MAY** use AI to assist with installing the required software.
- You **SHOULD** make sure you have a package manager installed that can automate most software installations, for the future.
- **Motivation**: This is not an examined part of the course and you should preferrably not get stuck on this point so you are free to do as you please. In order to gain more control and understanding, it is better if you use a dedicated package manager.
- **Example**: A student is struggling to get git working in WSL2, so they ask Copilot for help, and follows the instructions received.

Creating a Software Design

- You **MUST** understand the fundamental object oriented design principles that form the basis of a good software design
- You **MAY** use AI tools to help you with the *syntax* of a diagram.
- You **MAY** use AI tools to explain how to improve a software design using fundamental object oriented design principles.
- You **MUST NOT** use AI tools to generate the entire diagram for you.
- **Motivation**: Understanding and applying fundamental object oriented design principles is at the core of this course, and is a critical skill as a software engineer.
- **Example**: A student is unsure how to make a design more maintainable so they reason with ChatGPT to understand how classes and objects interact. They then create a software design based on this understanding.
- **Example**: Having manually created a UML class diagram, a student asks ChatGPT whether it correctly follows UML syntax. Where the AI tool identify issues, the student verifies the correct syntax against the course book and other sources.

Applying Design Patterns

- You **MAY** use AI tools to explain what is expected of you.
- You **MAY** use AI tools to explain and give examples on how a specific design pattern work.
- You **MUST NOT** use AI tools to generate the updated design.
- **Motivation**: The learning objective here is to understand how a particular design pattern improves the design, and how generically described design patterns must be adapted to the context of a specific software design. Doing this adaptation means that you will learn more about both how the design patterns work to improve a software design, how you can create more maintainable programs by accurately using features inherent in the programming language, and how you can prepare your software design for future challenges.
- **Example**: A student discuss design patterns with their AI before manually adding the required classes to their software design.

Implementation

- You **MUST NOT** use GenAI tools to write any source code or code documentation.
- You **SHOULD** discuss with your friends.
- **Motivation**: The point of this assignment is to understand the knowledge gap between a software design and the resulting software implementation, and to start exercising the skills necessary to bridge this gap. Using an AI tool for this would seriously impede this understanding. Discussing with your friends is a vital learning tool, and the big difference between that and using an AI tool is that your friends know when to stop explaining and let you find the solution on your own.
- **Example**: A student is struggling with how to write the source code for an assignment, so they discuss with their classmates who show and explain how they solved the same task.
- **Example**: A student used a GenAI tool to generate source code from the given software design, and as a result fails to learn how to create a design that is easy to implement.
